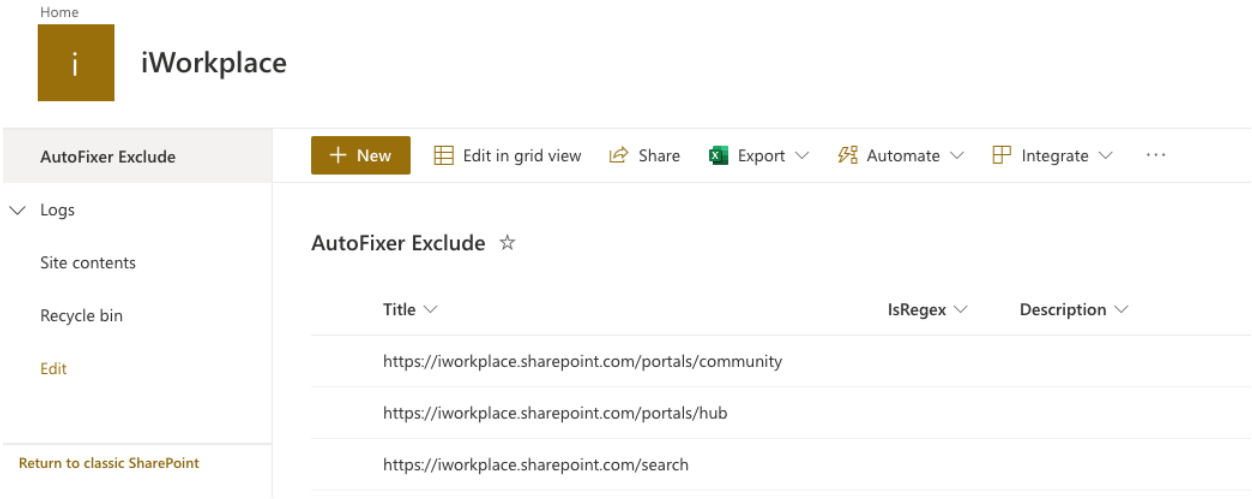
Autofixer Configuration

Front End Configuration

Depending on how AutoFixer is configured on your system you will have an "AutoFixer Include" or "AutoFixer Exclude" list in your iWorkplace configuration site ([yoursite]/sites/iWorkplace).

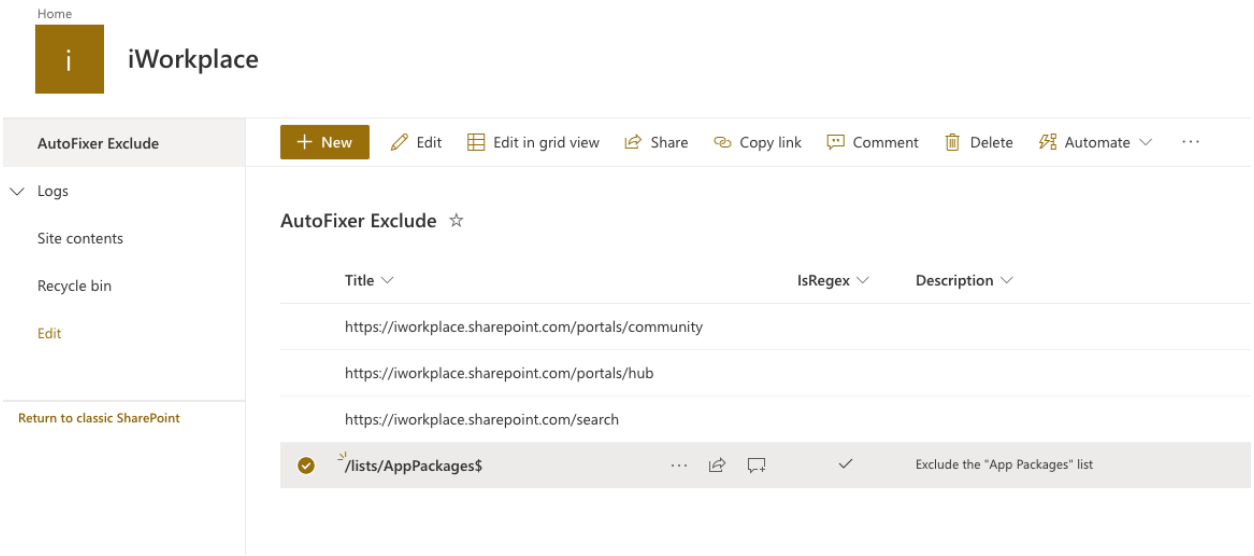
This list controls the site collections (or single sites) that are crawled by the AutoFixer Engine.



AutoFixer Include	Autofixer **only** runs against site collections **in** this list. All other sites will be ignored
AutoFixer Exclude	Autofixer engine runs against **all** site collections **except** those specified in the list

Pattern Matching

It is possible to use regular expressions to perform more complex pattern matching – this is only possible when using an "exclude" list. To mark a rule as a regular expression, simply check the **IsRegex** column. For those new to regular expressions, https://regex101.com/ is a great tool for building and testing regular expressions. To exclude a list like the App Packages list from in all sites, you might use a regular expression like "`/lists/AppPackages$`" (the $ is an end of string marker that ensures you don't get a match with **/lists/AppPackagesToScan**).



Regular expressions can be hard to read so it is a good idea to include a description. Be careful when using complex regular expressions in an exclude list. The exclude list is processed until the first match. It is very easy to create a rule that accidentally excludes everything.

Site Collections vs Subsites

If a site collection is added to an Include/Exclude list then Autofixer will include/exclude **all** subsites under that site collection. If different behaviour is desired for each subsite then each site will need to be added separately.

Subsites added to an Include/Exclude list must be a direct URL to the site, not a list/page in the site (don't just copy and paste the URL from the address bar).
E.g. ([yoursite]/sites/[sitename]/[subsitename])

A more advanced example would be:

Use a regex to exclude all sites except those with a specific name or naming convention using this regex:
(?i)/sites/(?!(ShortTitle or Prefix))

You can combine multiple prefixes or ShortTitles by adding a pipe character between each.
(?i)/sites/(?!(Workspaces|TemplateCentral|TEAM-|PROJ-|ECM-))

This will exclude all sites except those which have a ShortTitle starting with ‘Workspaces’, ‘TemplateCentral’, ‘TEAM-‘, ‘PROJ-‘ or ‘ECM-‘.
