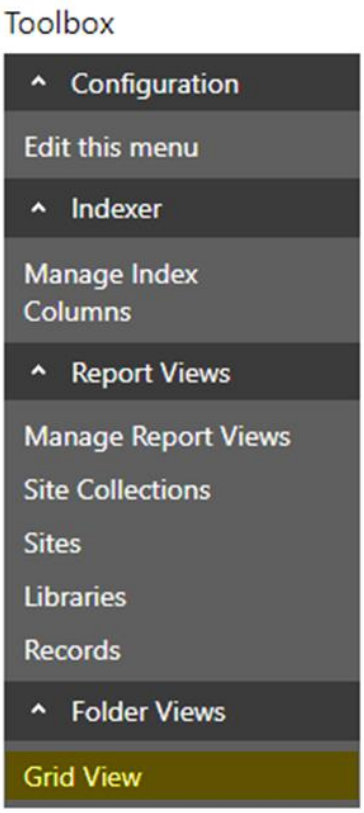
Folder views

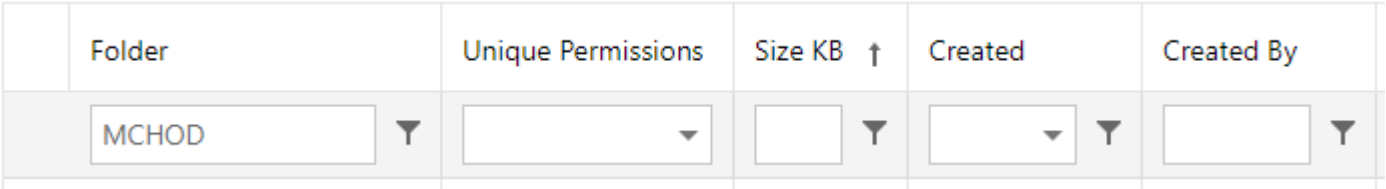
The *Folder Views > Grid View* link on the home page of the **Smart Records** site is not available for all customers, it will only appear if it has been expressly activated. Please contact your SharePoint consultant if you would like this option included in Smart Records.

This view displays a list of the folders in selected site collections in your tenancy. It is a useful way to monitor what is happening with folders in site collections.



Below are some useful instructions to help you use the folder views as there several deviations from the other report views. It is important to note that ad-hoc changes only last while you stay on the report, they are not saved back to the report design.

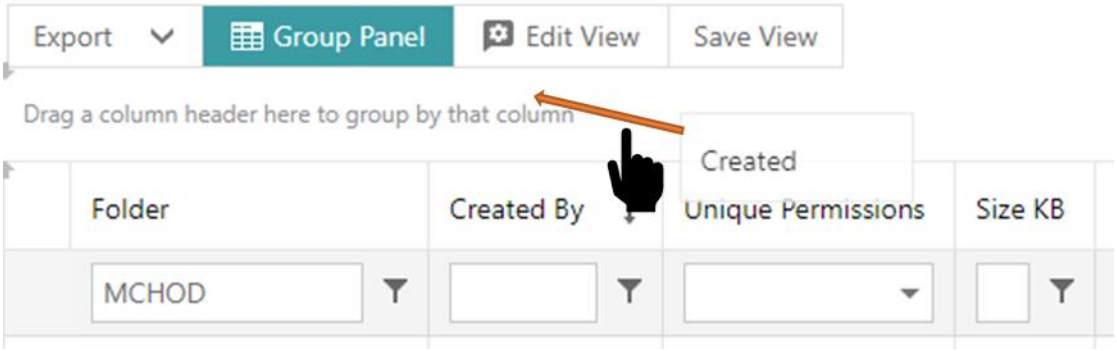
Ad-hoc filtering



This works the same as the other views, allowing you to narrow down the results you have found as follows:

- Under each of the column names enter what you are looking for. The search will start working as you type so you only need to enter a few letters. e.g. in the Document type box you could type "corr" to look for correspondence.
- You should see that the number of items shown will reduce.
- You can continue to narrow down your search by entering filters in the other columns.
- By default, the filter does a "contains" search. You can change this by clicking on the stick icon to the right of the column e.g. you can select "Equals" or "Does not contain".

Ad-hoc grouping

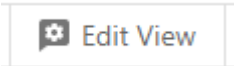


To group the results based on one of the fields you will first need to click on the Group Panel button. You can then drag the name of the field to the space where it states, *Drag a column here to Group by that column*. You can drag multiple columns to create a nested grouping.

Ad-hoc column changes

It is also possible to reorder columns on-the-fly by dragging the headings around.

Edit View

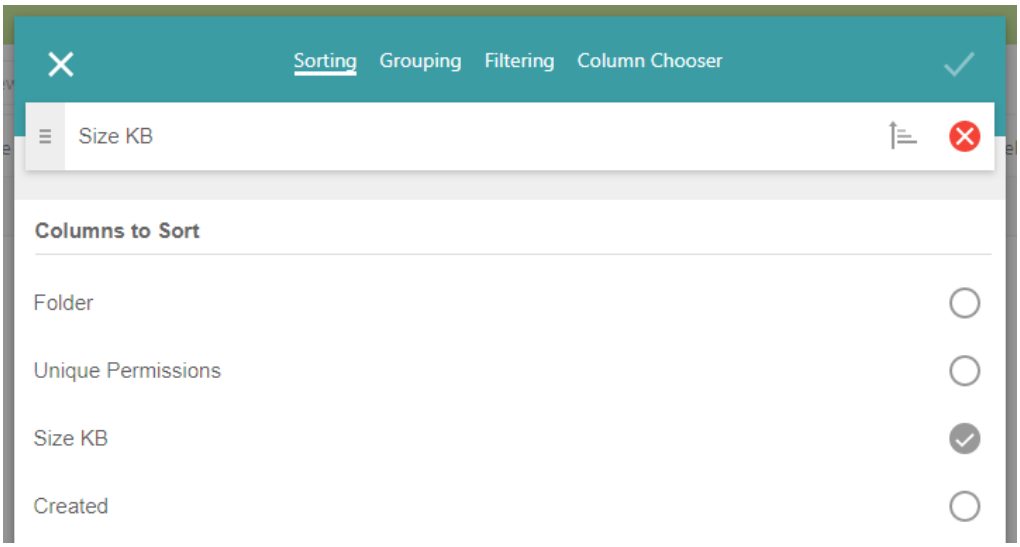


The folder views cannot be managed from **Managed Report Views** like the other views. Instead, the view can be updated by clicking on the **Edit View** button. This will show a new window that allows you to make changes to the current view. The changes can be completed by clicking on the tick on the top right of the window.

The changes that can be made to the view are explained in more detail below:

Sorting:

The columns to sort on can be selected, including whether its ascending or descending.

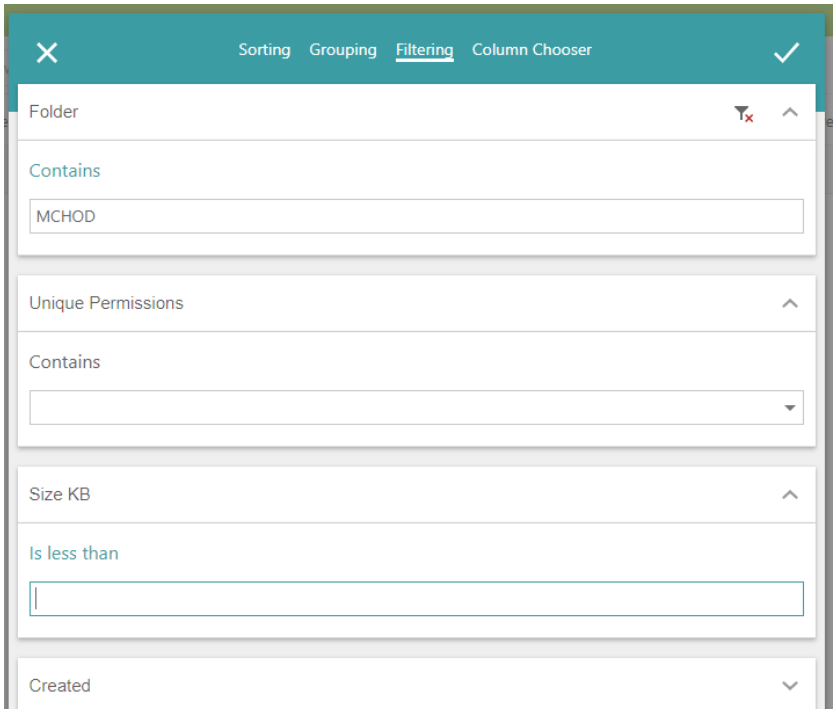


Grouping:

The columns to group on in the view can be selected from the list of columns.

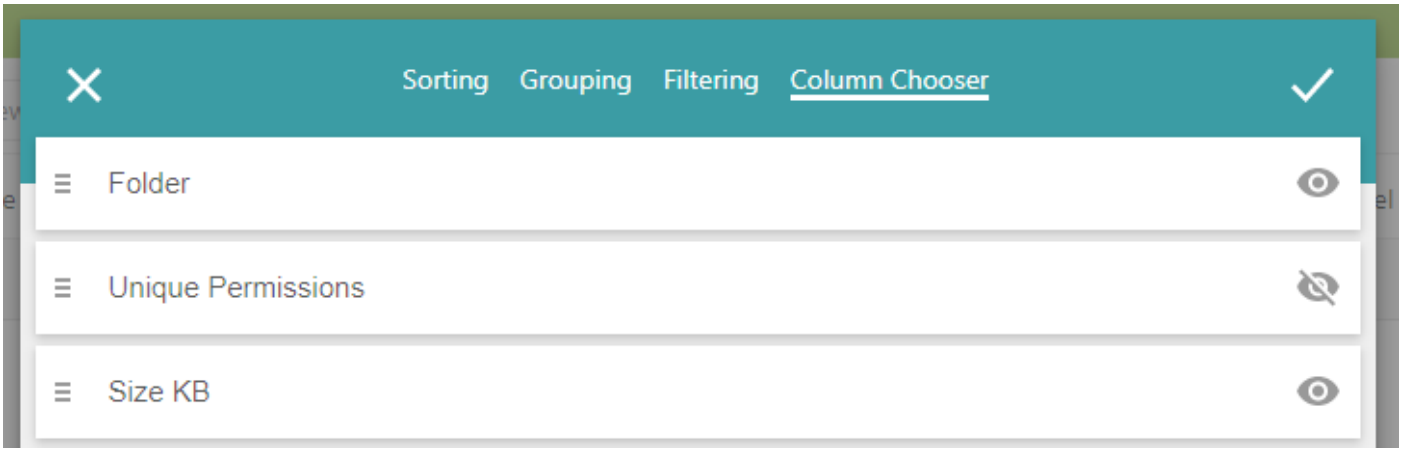
Filtering

The filters can be applied to specific columns. The default condition applied by the filter is “contains” however this can be changed by clicking on “Contains”. More than one column can be included in the filter, but these are joined together by the AND statement.



Column chooser

Choose the columns that you want to be visible in the view. The visible columns are indicated with an open eye, the hidden columns are indicated with a crossed out eye. To make a hidden column visible click on the eye icon.



The order of the columns can also be changed by clicking and holding down the 3 small lines to the left of the column name and dragging the column to its new position.

Export

You can export the results shown to Excel, Rich Text Format, comma separated values (CSV), PDF or Docx. This is a useful way to save the results of the report and distribute them to others.

All items that are included in the result set will be exported regardless of whether there is a filter in place or only some items are selected. If you want to export a selection of the result set, you will need to change the Filter in the **Edit View** form.

There are some size limitations with these some of the formats. If you are downloading a large data set, then the best format to choose is CSV. If you do have issues with the data set being too large to download, simply create two or more reports that split the data into more manageable chunks.

Save View

Once you have made your changes to the current view using **Edit View** and you want to save these changes for the next time you open the *folder view*, click on **Save View** to keep the changes.
