Permissions to Smart Records

Smart Records site and app permissions are not managed through the workspaces register but are instead managed using OOTB SharePoint Permissions Management.

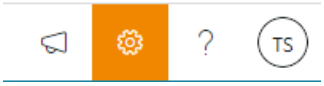
The best practice is to manage through AD / AAD groups Records Managers Group however you can also add individuals by name to the Sites Members Group.

As Records Manager is only setup in special record management sites there's not permissions level restrictions beyond having access to that site. As long as they have access to that site they will have access to SR.

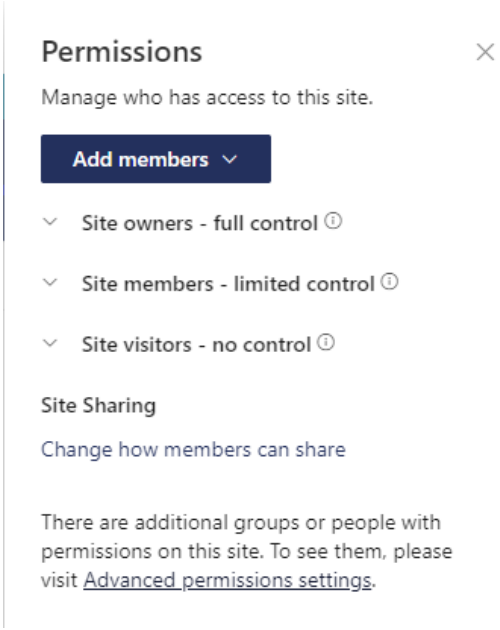
Manage permissions through the site where Smart Records has been installed. Generally found by typing into the address bar

https://[client instance]/sites/smartrecords

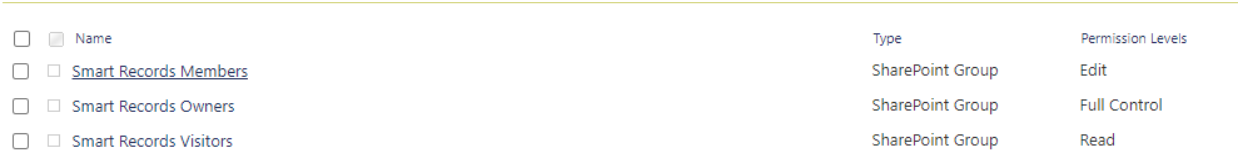
1. Site Settings (Cog)



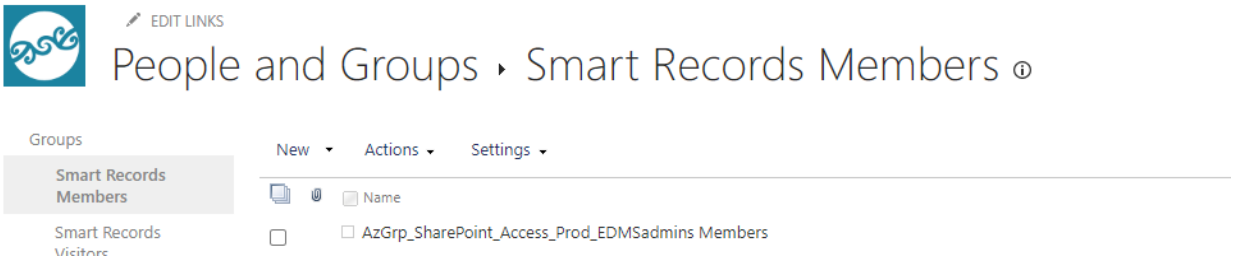
2. Site Permissions > Advanced permissions



3. Add permissions group from AD/AAD to **Smart Records Members** (or individuals by name if organisation is not managing centrally through an active directory system)

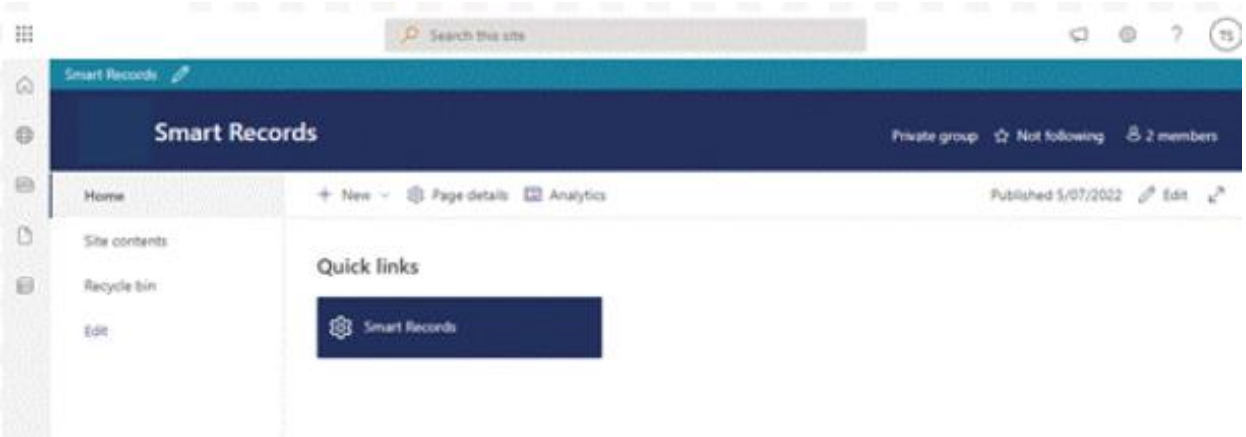


4. Select New and add group



Link to Smart Records Site will usually be found using the following URL pattern.

https://[client name].sharepoint.com/sites/SmartRecords



Once they have access to the site above they will have access to the site/features below.
