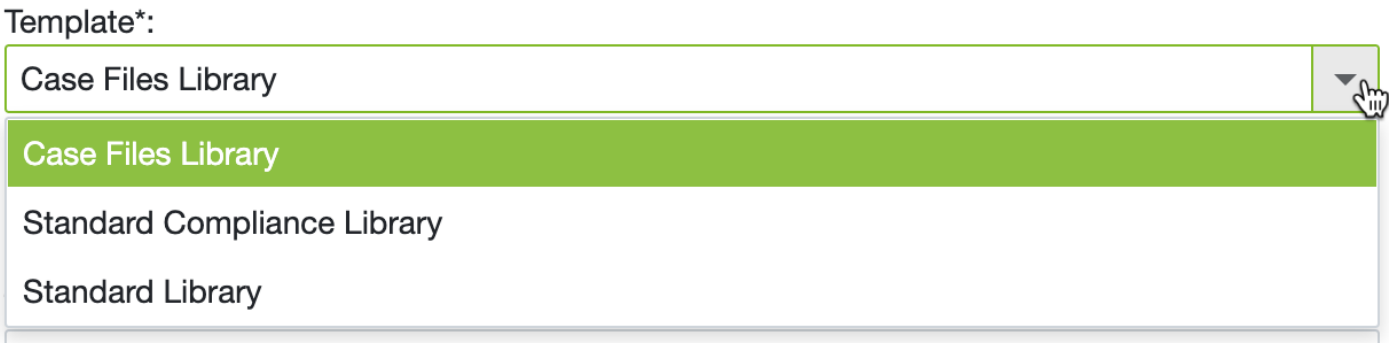
Creating Lists and Libraries

Any user with permissions to create lists in a site can use library builder to create a new list or library.

To start the process, navigate to the *iWorkplace* page in your team, under the *Library Builder* app, click *Create List or Library*.

Selecting a Template

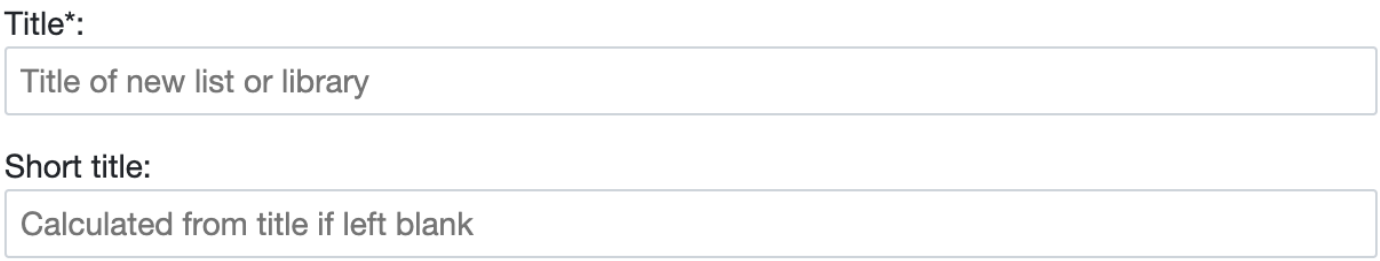
At the top of the form is a dropdown menu showing all the list and library templates currently available. Simply select the one you require. When you do this, the default value settings further down the form will change to match the template you selected.



Naming your List or Library

Once the template and destination has been selected you need to choose the name for the new list or library under *List title*.

Optional: You can also add a *Short title*, the *Short title* value will be used to form the URL of the list or library.



List Title

The name you want to give to the new library that will be displayed to users and added to the Quick Launch navigation.

The title must be unique. If a list or library with the same name already exists, then the creation will be cancelled. The only exception to this is when using the retrofit option.

Short Title

This allows you to enter a shorter name for the library to use in the URL. Whilst in modern browsers the length of URLs is less important, this can still make things easier for users when copying shortcuts, etc.

If *Short title* is left blank, the *List title* will be used to form the URL instead.

Regardless of whether you use *Short title* or not **Library Builder** will try and make the URL more 'browser friendly' by removing spaces, special characters, etc.

Retrofit if already exists?

Note: This option will only appear if Enable retrofit? is ticked within the Library Builder settings.

If a list or library with the same name already exists then the default behaviour is to cancel the creation process.

Retrofit is an option that allows the selected template to be applied to an existing library or list. For more information see the *Using Retrofit on a List or Library* section of this manual.

Copy contents of template?

Note: This option will only appear if Enable copy contents? is ticked within the Library Builder settings.

In some cases you may have a template that contains some sample documents or list items. This option lets you copy these items to the new library or list when using library builder.

This option is only intended for copying a small number of items that you would expect to find in a template. Even then the copy process can take a while. This option should not be used to copy 'production' libraries and lists from one site to another.

Column defaults

Library Builder will add a row for each column that meets any of the following criteria:

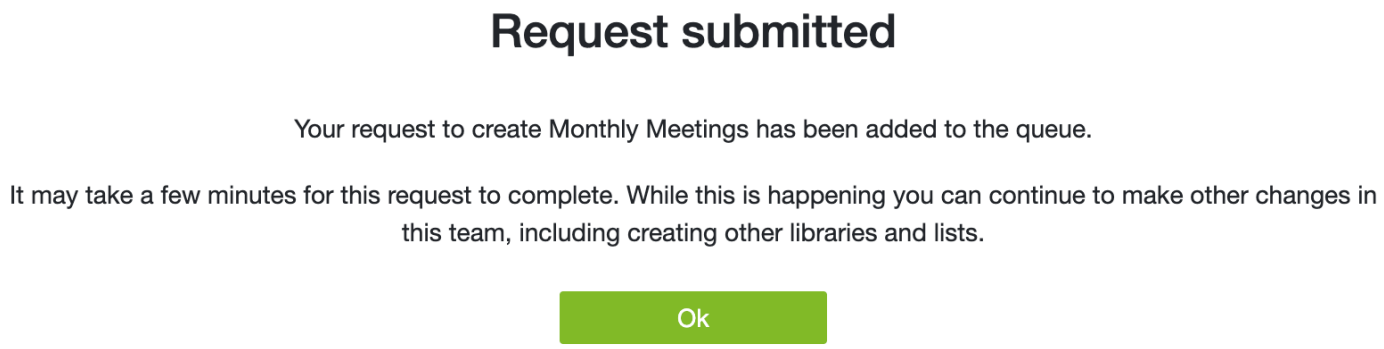
- A *choice* column with a single choice
- A *choice* column that's hidden
- A *single line text* that's hidden

You can set the defaults for these columns and these values will be automatically applied to documents within this library by *Autofixer*.

Create

Once you have specified all relevant information for the library or list, click *Create.*

After clicking *Create*, you will be taken to the page notifying you that your request has been submitted. From here, clicking *OK* will take you back to the Library Builder to create another List or Library if you need.



Progress

Once you click *Ok,* you'll be taken to the *My last request* tab where you can monitor the creation of the new list or library.

There is no need to stay on this tab during the creation and you can continue to make other change in SharePoint.

For more information on the *My last request* tab see the *My Request Views* section of this manual.
