Installing Smart Breadcrumb

In most cases this process only needs to be done once when the app is first installed. Occasionally a new release may require a new version of the app file to be uploaded to the App Catalogue.

There are three primary means of installing and deploying the iWorkplace 365 Smart Breadcrumb solution:

1. **Single site(s) Deployment:** Install the solution to the tenant app catalog and then activate the extension on specific site(s) using the SharePoint Feature Framework-based activation option.
2. **Tenant-Wide Deployment:** Use the tenant-wide deployment option for extensions from the app catalog.
3. **Tenant-Scoped Deployment:** Use the tenant-scoped deployment option and activate the extension on multiple specific sites.

In each of the above three cases, the app must first be added to the tenancy app catalog.

Accessing the App Catalogue Site

The exact url for this site can be different between systems but two common ones are:

https://*customer*.sharepoint.com/sites/apps

https://*customer*.sharepoint.com/sites/appcatalog

If you are not sure what the URL is then you can access the App site details from the SharePoint Administration Site https://*customer*-admin.sharepoint.com

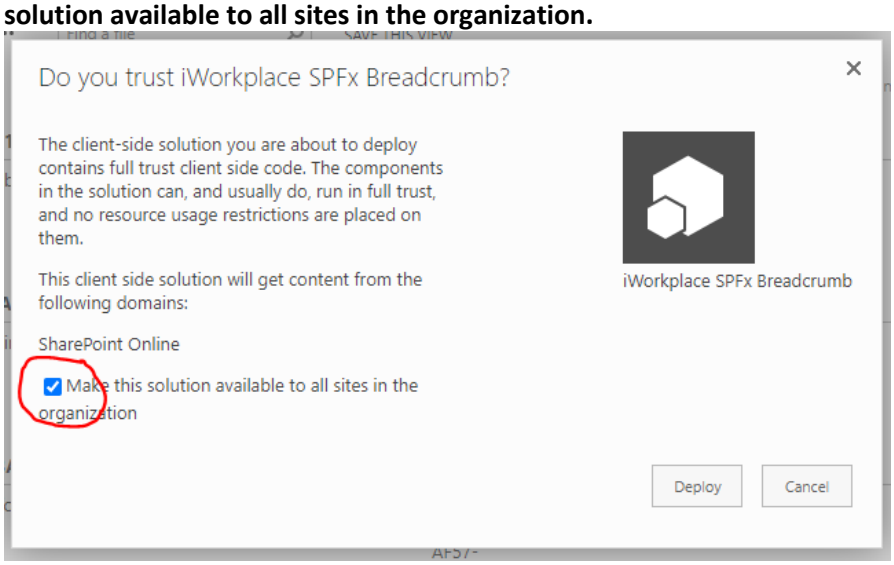
- Go to **...More features**
- Click **Open** under **Apps**
- Click **App Catalogue**

This will either have a link to your app catalogue site; or if the site does not currently exist it can guide you through the process of creating one.

Tenant-wide deployment

This is the easiest method of deployment and will add the Smart Breadcrumb to every site within the tenancy. The breadcrumb can be disabled on specific sites if necessary.

1. Navigate to the Tenant's **app catalog** site and select the **Apps for SharePoint** list.
2. Upload or drag and drop the solution file (.sppkg) to the app catalog.
3. SharePoint display a dialog and asks you to trust the client-side solution. Check the box entitled **Make this solution available to all sites in the organization.**



4. Select the **Deploy** button.

Tenant-scope deployment

Normally with apps we want to let site owners decide if they want an app added to their site or not. But because Smart Breadcrumb is used to standardise navigation and give sites a sense of place it is important that it is pushed out to all sites.

To do this we have to install the Smart Breadcrumb app in the App Catalogue and then use the deploy option to push the app out to other sites. To do this:

1. Go to the **App Catalogue** site if not already there
2. Open **Site Contents**
3. Select **App** from the **+New** menu
4. Select **Return to classic SharePoint** in the left hand nav
5. Wait for the Smart Breadcrumb app to install
6. Click on the **… menu** for the app and select **Deployment**

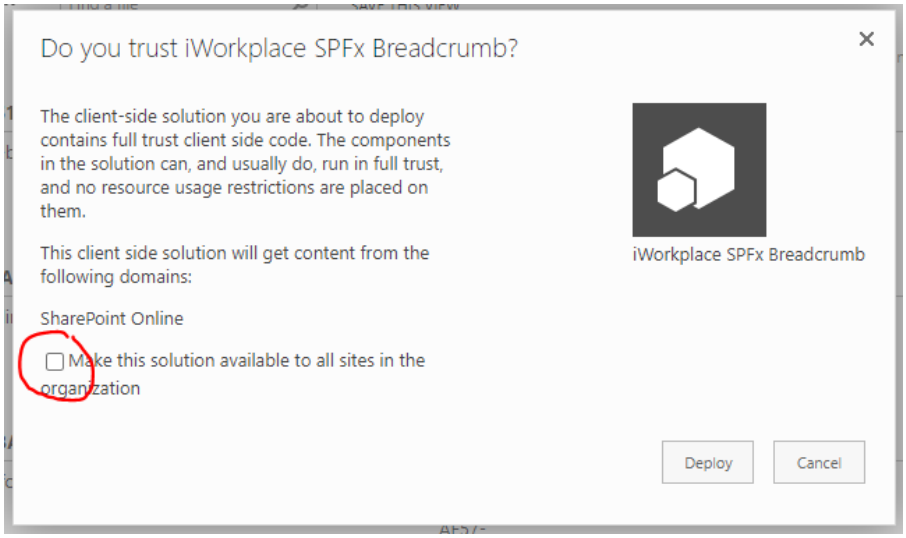
This will take you to a screen that lets you configure individual site collections, managed paths, or site templates that the app should be deployed to. Any changes made here are automatically applied to existing sites and new sites. Removing a site from here will remove the app from that site.

Notes about this method of deployment

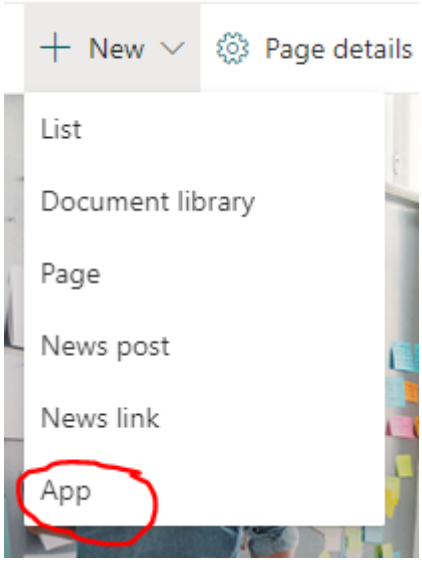
- Updating the app in the App Catalogue will update the app in all sites it is deployed to.
- Because the app is pushed by an administrator, site owners will not be able to remove the app from a site that meets the deployment criteria. Not even a site collection administrator can remove the app. Site administrators can configure the app to not display, however.

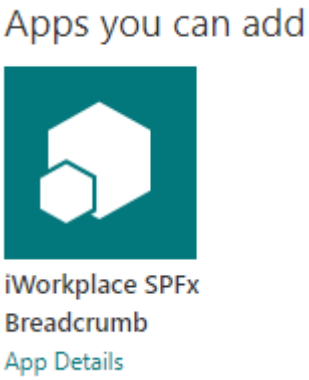
Specific site(s) deployment

1. Repeat steps 1 and 2 as per the Tenant-Wide Deployment noted above.
2. When SharePoint displays the dialog and asks you to trust the client-side solution **do not** check the box entitled **Make this solution available to all sites in the organization.**



3. Browse to the site in which you wish to install the app. Select New > App





From the Apps you can add selection, choose iWorkplace SPFx Breadcrumb
