Constraints

Not supported for use with Smart Metadata

Adding Smart Metadata to a library where folders are created with Smart Case Files is not supported. The reason for this is that both products have similar functionality which, if configured incorrectly, could conflict. This could cause repeated changes to metadata values, inconsistent metadata and even data loss.

Our recommendation is that Smart Metadata functionality is never configured on a Smart Case Files controlled library.

Columns to copy sharing internal and display names

You can't have column names where the display name of one column matches the internal name of another column.

E.g. Two columns:
Display Name = **Something**, Internal Name = Title.
Display Name = SFSomething, Internal Name = **Something**.

Both items will be saved to the property bag settings for Smart Case Files (even though only one is displayed as selected on refresh).

The mechanism to match what is displayed in the interface attempts to match on either the Internal or Display names, therefore selecting both and saving the settings will return the first column to the interface, twice. Only that one item will be displayed as selected.

Workaround:

Do not use the display name of a column as the internal name of another column.

Punctuation

SCF folder names cannot contain any of the following symbols: | \ " ' / [ ] : < > + = , ; ? * @

Use of % symbols within a Case Title will cause unexpected behaviour including but not limited to malformed Folder URLs and creation of multiple Case Folders (one of which will likely be decoupled).

Note: this will fail!

Square brackets are supported [].
Although the character **"#"** and some other special characters won't be blocked, using them can cause issues, thus it's best to avoid doing so

Folder names cannot start or finish with spaces or hyphens.

See **Restrictions and limitations in SharePoint – Special Characters**

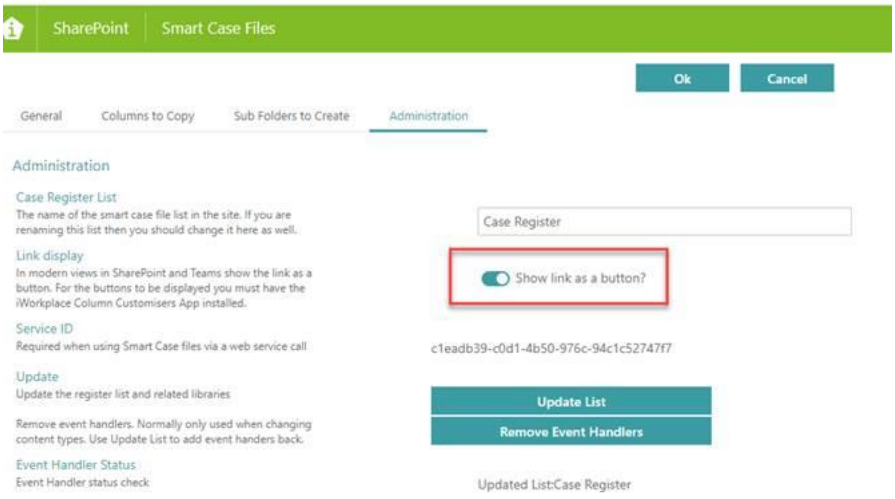
50 Characters

In addition to the above special character limitation, the channel name cannot exceed 50 characters. In the sidebar and team channel list, channel names of more than about 30 characters. So, in practice, try to limit the channel names to fewer than 30 characters.

Showing Link as a Button

If “show link as a button” is selected the iWorkplace Column Customiser App must be installed, otherwise the buttons will not appear. This is noted in the fine print under Link Display.

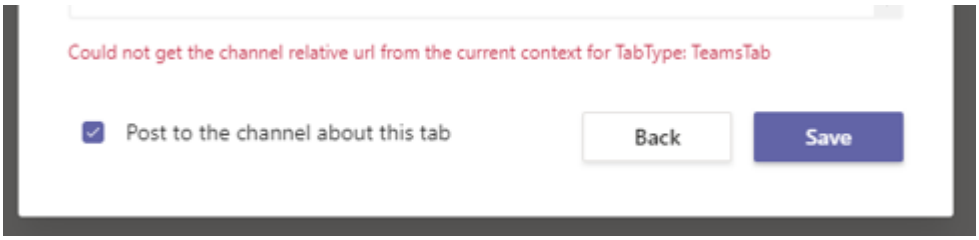
If Column Customiser is not installed, the folders have still been created in the library but are not accessible from the register.



Error message on creation of new OneNote in new Channel

Currently there is a Microsoft bug where by you cannot create a new OneNote Notebook in a channel that is created using the Microsoft Graph API. SCF uses the Microsoft Graph when creating channels associated with folders. After a channel is created, if you then attempt to add a new OneNote Notebook you will receive an error stating “**Could not get the channel relative url from the current context for TabType: TeamsTab**”.

The current workaround to this issue is to create the new Notebook from the **General** channel and then link to this Notebook from the new channel.



List and Library naming

Case Register Lists can be freely renamed; however, you must ensure that the name is **unique**.

The Register List display name **must be unique** to the site and cannot be shared by any other List or Library.

Where they must be similar, add the word Register after the desired name so as not to conflict with the Library that Smart Case Files will integrate with.

E.g. GOOD.

Case Register: Employee Files **Register**
Library: Employee Files

E.g. BAD.

Case Register: Employee Files
Library: Employee Files

Why is this bad? SharePoint thinks all Libraries are Lists and treats them identically – this causes no end of issues in the back end of the service.

Changing “Columns to Copy” does not update existing Register Item

Setting or changing the "Columns to copy" only affects future register edits. It does not re-process the entire register. If you make changes to this setting and need the columns to be copied for existing register items, edit those items to trigger an update. If you need to do this in bulk, contact Customer Success for a script to help.

Confidential folder permission inheritance after 100,000 items

SharePoint has a limitation where a list, library or folder with more than 100,000 items in it cannot break permission inheritance and cannot re-inherit permissions on it. This is something that may need to be considered when using the Smart Case File register or cases with confidential folders.

Consider if this may be potential a long-term concern with:

- How many files and how file growth will be handled within a case file
- How permissions are handled for high volume file case files
- How many items will be stored in a case register

SFStatus

In some automation scenarios you may be tempted to change the type of the SFStatus column to make it easier for automated systems to set the value. This may appear to work but some background administrative tasks may stop working as they no longer have access to the list of case libraries contained in the column definition. Take the time to build a system that can update the choice column including, where necessary, the column definition.
