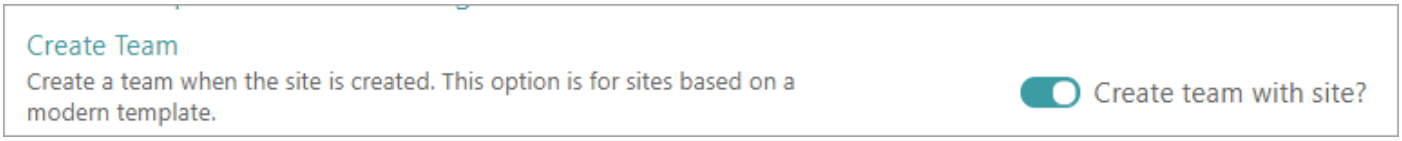
0365 Groups and Teams

The settings for groups and teams can be found under the *0365 Groups and Teams* tab in the **Smart Provisioning** settings.

Create Team



This option controls a number of different scenarios depending on the template site your using and how its configured:

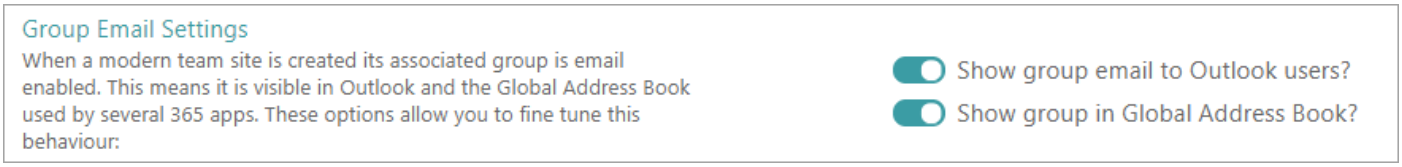
Create team is not enabled

Source site template	Created with Team?	Team Template copied?
Classic site – without group	No	No
Classic site – with group	No	No
Modern Team – without group	No	No
Modern Team – with group and standard team	Yes	No
Modern Team – with group and modified team	Yes	No
Modern Communication -without group	No	No
Modern Communication -with group	No	No

Create team is enabled

Source site template	Created with Team?	Team Template copied?
Classic site – without group	No	No
Classic site – with group	No	No
Modern Team – without group	No	No
Modern Team – with group and standard team	Yes	Yes
Modern Team – with group and modified team	Yes	Yes
Modern Communication -without group	No	No
Modern Communication -with group	Yes	Yes

Group Email Settings



When a modern team site is created its associated group is email enabled. This means it is visible in **Outlook** and the **Global Address Book** used by several 365 apps. These options allow you to fine tune how visible the group email is.

Show group email to Outlook users will allow the group to show in the left-hand navigation of **Outlook 365**. It also allows the group name to resolve when creating a new message in Outlook. It's important to note this option also removes the group from the **Global Address Book** even if the *Show group in Global Address Book* is enabled.

If *Show group in Global Address Book* is disabled and *Show group email to Outlook users* is enabled the users will still be able to see the group in the left-hand navigation and the group name will resolve when creating a new message.

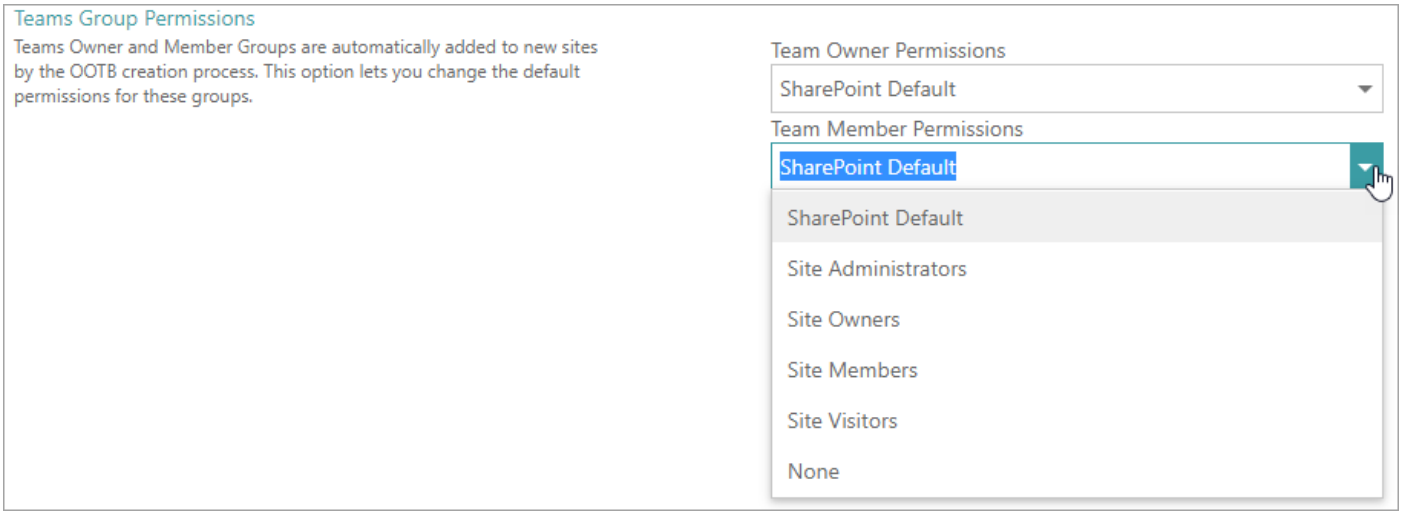
Removing the group from the **Global Address Book** affects not only **Outlook** but also other apps that use it e.g. **SharePoint** user columns.

Both settings are enabled by default.

Teams Groups Permissions (previously called Administrator 0365 Groups)

With OOTB SharePoint teams enabled sites Teams Owners and Members groups are automatically added as Site Administrators and Site Members group in the SharePoint site.

Previously Smart Provisioning only allowed two options; to remove the members group or remove both groups. This functionality has been updated so you now have a full set of options for each:

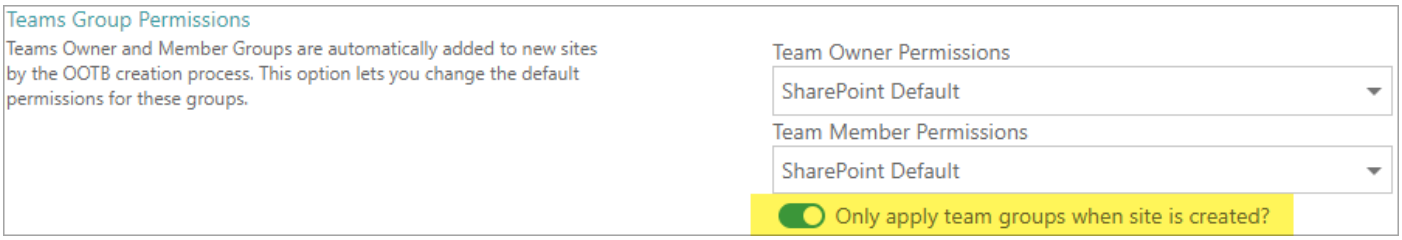


Selecting *SharePoint Default* for Team Owners means the group will be added to Site Administrators. Selecting *SharePoint Default* for Team Members means the group will be added to Site Members. You can select a custom level of access for each by choosing which Site Group the Team groups should be added to. There is also a *None* option for each which will remove the team group from the site.

The old settings will be automatically mapped to the new settings as follows:

- Old option 1 *"Remove Team Owners and Members groups from site"*:
  - Team Owner Permissions: None
  - Team Member Permissions: None
- Old option 2 *"Team Owners have Administrator access, Team Members access removed"*:
  - Team Owner Permissions: SharePoint Default
  - Team Member Permissions: SharePoint Default

By default, these changes are only applied when a site is created, but you can change this with the following setting to also apply any changes to existing sites the next time the Smart Provisioning list item is updated:



When to apply Permissions

When to apply Permissions

The O365 Group (Team) permissions will normally be applied when the Site Register item is created or edited.

Smart Provisioning can just set the permissions at create, after that the permissions can be managed directly in the team.

You can also disable all Smart Provisioning management of O365/Teams access and control this with Teams and O365 group membership instead.

Partly managed means users can be added via the list item or in Teams at any time. However removing them in the list item will not remove them in Teams, this must be done manually.

- (●) Created and modified (default)
- ( ) Create only (manage changes in 0365 Groups or Teams)
- ( ) Partly managed, adds but does not remove
- ( ) Manage all access in 0365 Groups or Teams

Created and modified

This option updates the access to the team Owners and Members groups when the site and team is first created but also every time the Provisioning Register item is edited. Any changes made directly by an Owner are lost the next time the Provisioning Register item is edited.

Create only

This means the access is only set by Smart Provisioning when the team is first created, after that Owners can control the access directly in Teams.

Partly managed, adds but does not remove

Users can be added via the list item or in Teams at any time. However, removing them in the list item will not remove them in Teams, this must be done manually.

Manage all access to O365 Groups or Teams

Smart Provisioning does not control access to the site. Owners have full control of access as soon as the Team is created. This option also disables the Owner and Manager settings below.

Owners and Members

Owners

Use a column, login or leave as is. One or more columns can be selected from the list. You can enter multiple users split with either , or ;. Please note that external users can not be Team Owners so they will be added as Team Members instead.

- ( ) Do not update
- ( ) Use columns (specified below)
- ( ) Use logins (specified below)
- (●) Use both

User Logins:

Columns:

Enter text to filter...

- [ ] Contributors
- [x] Owners
- [x] Project Mgr
- [x] Site Admins

Members

Use a column, login or leave as is. One or more columns can be selected from the list. You can enter multiple users split with either , or ;

If you select *Do not update* then the O365 Members group will remain in the Site Members group even if the *Create and Modified* option is selected for **When to apply permissions**

- (●) Do not update (manage in teams)
- ( ) Use Columns (specified below)
- ( ) Use logins (specified below)
- ( ) Use both

The Owners and Members settings are used to set how Smart Provisioning controls access to the site. For example the Owners can be set users and/or taken from particular columns in the Sites Register.
